Coronal loop structures and locations of their foots points

G.A. Porfir'eva, G.V. Yakunina, A.B. Delone

Sternberg Astronomical Institute, Moscow, Russia

Some observational cases of various locations of loop foots points and some phenomena in solar loop stuctures have been considered. Loops appear to respond to the physical situation in their foots sites. Literature dates about observations in different spectral regions and H_{α}-scans obtained at High Altitude Station near Alma-Ata using coude-refractor Opton have been used.
